

1. Student information

Name: Saul Gil

Id: 32239288

College: SW Convergence College

2. Introduction

The purpose of this project is to develop a supermarket management system using the Java programming language knowledge acquired during the semester. The application simulates the basic operations of a real supermarket by allowing the administrator to manage food products, employees, customer bills, and the supermarket's earnings.

3. Explain the application functionalities.

The system contains a predefined inventory of food products, where prices can be updated and new stock can be ordered from suppliers. When products are ordered, the supermarket's inventory increases and the corresponding cost is deducted from the supermarket's available money.

The program also includes an employee management system with different categories of workers, including Cashiers, Replenishers, Managers, and Co-Owners. The administrator can hire new employees, remove existing employees, and increase their salaries.

In addition, the application allows the creation of customer bills. A bill stores the customer's name, the products purchased, the quantities bought, the cashier who attended the customer, the total amount paid, and the day of purchase. The system automatically calculates the total cost based on the predefined prices of the products and updates both the supermarket's earnings and the inventory quantities.

5. freely write anything about your app.

The code has it certain way to act, i mean how you have to put the input, you have to type in section 9 the following way: food quantity, food quantity... and also we have to care about the exact name of the employee and if that employee is a cashier.

6. Github code: <https://github.com/saulgilvarona/Gil-Saul-Term-project-planning-Java-Programming>
